Stability control systems (CE)

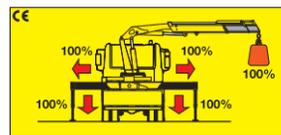

HM System

The **HM System** integrated in the load limiting device checks the stabilizers' positions. Only when all beams are fully open and all stabilizers are on the ground the crane can operate and lift loads.

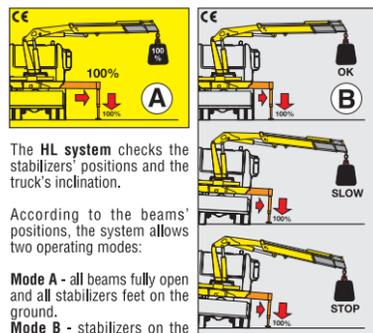

HML System

The **HML System** integrated in the load limiting device checks the stabilizers' positions. Only when all beams are fully open and all stabilizers are on the ground the crane can operate and lift loads.

HL System

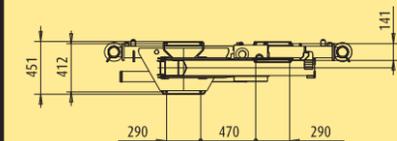

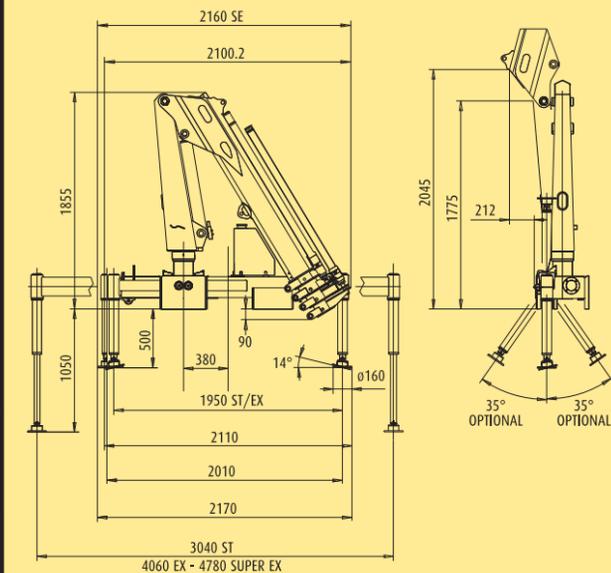

In **mode A**: the load limiting device stops the crane when the crane reaches 100% of the nominal capacity.
In **mode B**: a dedicated sensor monitors the truck's inclination. The load limiting device stops the crane before it reaches an inclination angle dangerous for stability, or when the crane reaches its nominal capacity.

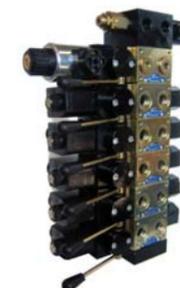

According to the beams' positions, the system allows two operating modes:

Mode A - all beams fully open and all stabilizers feet on the ground.
Mode B - stabilizers on the ground only.

HA 50

- Compact dimensions and reduced weight
- Proportional speed control of any single movement
- Stabilizer control by radio
